

Java Programming (COMP217009)

Spring, 2020

Instructor: Sangtae Ahn

Final Exam

- The first line in all your codes should type your student ID and name as a comment.
ex) // 20201234 Sangtae Ahn
- Your code should satisfy all the given requirements.

Q1. (10 points)

Fill out the missing parts (marked as // **FILL OUT** //) to design a class named ***Location*** for finding maximal, minimal values and their locations in a two-dimensional array.

- 1) The class ***Location*** contains public data fields **row**, **column**, **maxValue**, and **minValue**
- 2) Public data fields **maxValue** and **minValues** are ***double*** data types and they store the maximal and minimal values in a two-dimensional array, respectively.
- 3) Public data fields **row** and **column** are ***int*** data types and they store indices for **maxValue** and **minValue** in a two-dimensional array.
- 4) Print **maxValue**, **minValue**, **row** and **column**.
- 5) Do not edit the code or rename the variables.
- 6) Submission File Name: **Q1_FindLocation.java**

Q2. (10 points)

According to the given UML, design a class named ***Rectangle*** to represent the width, height, area, and perimeter. Satisfy the following requirements.

- 1) Class name: ***Rectangle***
- 2) Write a test program that creates 3 ***Rectangle*** objects:
Rectangle(), ***Rectangle(4,40)*** and ***Rectangle(3.5,35.9)***
- 3) Print the width, height, area, and perimeter for each object.
- 4) Submission File Name: **Q2_TestRectangle.java**

Rectangle	
width: double	The width of this rectangle (default 1).
height: double	The height of this rectangle (default 1).
Rectangle()	Constructs a default rectangle.
Rectangle(width: double, height: double)	Constructs a rectangle with the specified width and height.
getArea(): double	Returns the area of this rectangle.
getPerimeter(): double	Returns the perimeter of this rectangle.

Q3. (15 points)

According to the given UML, design a class named ***Time*** to represent the hour, minute, and second. Satisfy the following requirements.

- 1) Class name: ***Time***
- 2) Write a test program that creates 3 ***Time*** objects:
Time(), ***Time(5555500000)***, and ***Time(5, 23, 55)***
- 3) Print the hour, minute, and second for each object.
- 4) Submission File Name: **Q3_TestTime.java**

Time	
-hour: int	The hour for the time.
-minute: int	The minute for the time.
-second: int	The second for the time.
+Time()	Constructs Time for the current time.
+Time(elapseTime: long)	Constructs Time with a specified elapse time in milliseconds.
+Time(hour: int, minute: int, second: int)	Constructs Time with the specified hour, minute, and second.
+getHour(): int	Returns the clock hour for the time.
+getMinute(): int	Returns the minute for the time.
+getSecond(): int	Returns the second for the time.
+setTime(elapsedTime: long): void	Sets a time for the specified elapsed time.

Q4. (15 points)

According to the given UML, design a class named *Triangle* that extends *GeometricObject*. Satisfy the following requirements.

- 1) An abstract class is given: **GeometricObject.java**
- 2) Write a test program that prompts the user to enter three sides of the triangle, a color, and a Boolean value to indicate whether the triangle is filled.
- 3) Print the area, perimeter, color, and true or false to indicate whether the triangle is filled or not.
- 4) Override the *getArea* method from **GeometricObject.java**
Override the *getPerimeter* method from **GeometricObject.java**
Override the *toString* method from **GeometricObject.java**
(*toString* method returns each side of the triangle)
- 5) Submission File Name: **Q4_TestTriangle.java**

Q5. (15 points)

Write a Java program that counts the number of characters, words, and lines in a file (file reading and writing). Words are separated by a space.

- 1) A text file is given: **Lincoln.txt**
- 2) Check the file exists. If not, print this message “Source file does not exist” and terminate the program.
- 3) Use *Exception*.
- 4) Use the *Scanner* class to read the file.
- 5) Write a text file (Q5_CountLincoln.txt) that includes the number of characters, words, and lines.
- 6) Check the file (Q5_CountLincoln.txt) already exists. If so, print this message “New file already exists” and terminate the program.
- 7) Submission File Names: **Q5_CountLincoln.java** and **Q5_CountLincoln.txt**

Q6. (15 points)

According to the given UML, design a class named *Account* to represent the balance, monthly interest, date when an account was created.

- 1) Class name: *Account*
- 2) Write a test program that creates an *Account* object with an account ID of 1122, a balance of \$20,000, and an annual interest rate of 4.5%.
- 3) Use the *withdraw* method to withdraw \$2,500
Use the *deposit* method to deposit \$3,000
- 4) Print the balance, monthly interest, and date when the account was created.
- 5) Submission File Name: **Q6_TestAccount.java**

Account	
-id: int	The ID of this account (default 0).
-balance: double	The balance of this account (default 0).
- <u>annualInterestRate</u> : double	The annual interest rate of this account (default 0).
-dateCreated: java.util.Date	The date when this account was created.
+Account()	Constructs a default account.
+Account(id: int, balance: double)	Constructs an account with the specified ID and balance.
+getId(): int	Returns the ID of this account.
+getBalance(): double	Returns the balance of this account.
+ <u>getAnnualInterestRate()</u> : double	Returns the interest rate of this account
+ <u>getMonthlyInterestRate()</u> : double	Returns the monthly interest rate of this account
+getDateCreated(): java.util.Date	Returns the date when this account was created.
+setId(id: int): void	Sets a new ID of this account.
+setBalance(balance: double): void	Sets a new balance for this account.
+ <u>setAnnualInterestRate</u> (<u>annualInterestRate: double</u>): void	Sets a new interest rate for this account.
+getMonthlyInterest(): double	Returns the monthly interest of this account.
+withdraw(amount: double): void	Withdraws the specified amount from this account.
+deposit(amount: double): void	Deposits the specified amount to this account.

Q7. (20 points)

Write a Java program that simulate an ATM machine by using the Account class created in Q6.

- 1) Create 10 accounts in an array with ID 1,2,3,... 10 and an initial balance of \$100.
The system prompts the user to enter an ID.
If the ID entered incorrectly, ask the user to enter a correct ID.
- 2) Once ID is accepted, the main menu is displayed as follows.
Choice 1 : check the current balance
Choice 2 : withdraw money
Choice 3: deposit money
Choice 4: exit the menu (return to enter an ID)
- 3) Once you exit, the system will prompt for an ID again.
- 4) The system will not stop once the system starts.
- 5) Submission File Name: **Q7_TestATM.java**

Here is a sample run.

```
Enter an ID: 4
```

```
Main menu
1: check balance
2: withdraw
3: deposit
4: exit
Enter a choice: 1
The balance is 100.0
```

```
Main menu
1: check balance
2: withdraw
3: deposit
4: exit
Enter a choice: 2
Enter an amount to withdraw: 30
```

```
Main menu
1: check balance
2: withdraw
3: deposit
4: exit
Enter a choice: 1
The balance is 70.0
```

```
Main menu
1: check balance
2: withdraw
3: deposit
4: exit
Enter a choice: 3
Enter an amount to deposit: 10
```

```
Main menu
1: check balance
2: withdraw
3: deposit
4: exit
Enter a choice: 1
The balance is 80.0
```

```
Main menu
1: check balance
2: withdraw
3: deposit
4: exit
Enter a choice: 4
Enter an ID:
```
